BOSTON (Oct. 16, 2024) – Boston Dynamics and Toyota Research Institute (TRI) announced today they will join forces, combining two of the world’s leaders in artificial intelligence and robotics. The research partnership aims to accelerate the development of general-purpose humanoid robots utilizing TRI’s Large Behavior Models and Boston Dynamics’ [Atlas robot](#).

“There has never been a more exciting time for the robotics industry, and we look forward to working with TRI to accelerate the development of general-purpose humanoids,” said [Robert Playter](#), CEO of Boston Dynamics. “This partnership is an example of two companies with a strong research-and-development foundation coming together to work on many complex challenges and build useful robots that solve real-world problems.”

“Recent advances in AI and machine learning hold tremendous potential for advancing physical intelligence,” said [Gill Pratt](#), chief scientist for Toyota and CEO of TRI. “The opportunity to implement TRI’s state-of-the-art AI technology on Boston Dynamics’ hardware is game-changing for each of our organizations as we work to amplify people and improve quality of life.”?

Boston Dynamics has a longstanding reputation for creating groundbreaking advances in humanoids, from [extreme mobility](#) to [bimanual manipulation](#). The latest generation of Atlas is the result of years of hardware/software co-design aimed at building the most capable humanoid platform, both in terms of physical capability and software interfaces for authoring whole-body behaviors. This makes it an ideal platform for advancing the science of AI-based manipulation skills.

Concurrently, TRI is widely recognized as a world leader in the rapid advancement of Large Behavior Models (LBMs) for robotics. This includes groundbreaking work on [diffusion policy](#), which pioneered the successful application of generative AI to advance dexterous manipulation capabilities in robotics. TRI has also played a leading role in the development of open-source robot AI [models](#) and [datasets](#). Leveraging additional strength in [computer vision](#) and [large-language model training](#), TRI’s work on LBMs aims to achieve multi-task, vision-and-language-conditioned foundation models for dexterous manipulation.

[Scott Kuindersma](#), senior director of Robotics Research at Boston Dynamics, and [Russ Tedrake](#), vice president of Robotics Research at Toyota Research Institute, will co-lead the Boston-based research partnership.

The project is designed to leverage the strengths and expertise of each partner equally. The [physical capabilities of the new electric Atlas robot](#), coupled with the ability to programmatically command and teleoperate a broad range of whole-body bimanual manipulation behaviors, will allow research teams to deploy the robot across a range of tasks and collect data on its performance. This data will, in turn, be used to support the training of advanced LBMs, utilizing rigorous hardware and simulation evaluation to demonstrate that large, pre-trained models can enable the rapid acquisition of new robust, dexterous, whole-body skills.?

The joint team will also conduct research to answer fundamental training questions for humanoid robots, the ability of research models to leverage whole-body sensing, and understanding human-robot interaction and safety/assurance cases to support these new capabilities.

About Boston Dynamics

Boston Dynamics is the global leader in developing and deploying highly mobile robots capable of tackling the toughest industrial challenges. Our robots are equipped with advanced mobility, dexterity and intelligence, enabling automation in unstructured or hard-to-traverse spaces, from manufacturing facilities, power plants, and construction sites to warehouses and distribution centers. We have three robots in our portfolio: Spot®, a quadruped that conducts industrial inspections for enterprise asset management; Stretch®, a box-moving robot currently being deployed with logistics and retail customers; and Atlas®, our humanoid platform currently in development. For more information on our company and our technologies, please visit www.bostondynamics.com.?

About Toyota Research Institute

Toyota Research Institute (TRI) conducts research to amplify human ability, focusing on making our lives safer and more sustainable. Led by Dr. Gill Pratt, TRI's team of researchers develops technologies to advance energy and materials, human-centered artificial intelligence, human interactive driving, and robotics. Established in 2016, TRI has offices in Los Altos, California, and Cambridge, Massachusetts. For more information about TRI, please visit? <http://tri.global>?
